More and more farming and ranching is becoming a game of numbers. By that, I mean statistical data is becoming more important than ever for planning - effecting supply and demand factors in agriculture, the interrelationship between production of crops and certain animals, and having an impact on a wide range of related agri-businesses.

While much of this information is provided at more frequent intervals during the year, we hope that the following Oklahoma Agricultural Statistics 1980 booklet will provide readers with a broad prospective of the state's agricultural industry and be of service to all users of agricultural statistics.

We are all indebted to the farmers and ranchers who voluntarily supplied information to the Oklahoma Crop and Livestock Reporting Service and helped insure its accuracy.

Sincerely,

Jack D. Craig

Jack D. Craig

P.O. BOX 1095
OKLAHOMA CITY, OKLAHOMA 73101

JOHN E. COCHRANE
STATE STATISTICIAN

JACK D. CRAIG
COMMISSIONER

Presented on the following pages of this report are estimates of Oklahoma's agriculture. We wish to express our appreciation to all of the crop and livestock reporters and agri-businessmen who voluntarily participated in the sample surveys which are the basis for the data.

The office staff who prepared these agricultural statistics are John Waldrop, Assistant State Statistician, with Agricultural Statisticians Burton Bartlett, Daryl Brinkman, James Heep, Riley Henderson, Monnie Miller, Dave Ranek, and Jennifer Tamm. The program support group includes Sharon Adams, Diana Carroll, Carol Coon, Juanita Currier, Minnie Dollarhide, Freda Eldridge, Barbara Ellison, Charlotte Gamble, Neoma Harryman, Judy Jarvis, Julia Morrow, Alberta Penix, Saroja Rathakrishnan, Kathy Sherfield, Ila Mae Spiva, and Pat Stevenson.

This publication was assembled under the guidance of Burton Bartlett and assisted by Judy Jarvis.

Current reports and forecasts may be obtained by writing the Commissioner of Agriculture or the State Statistician.

Sincerely,

John Cochrane

John E. Cochrane
State Statistician

OKLAHOMA CROP AND LIVESTOCK REPORTING SERVICE

SAMPLING METHODS AND ESTIMATION

The data collection program of the Crop and Livestock Reporting Service consists of a series of surveys designed to produce current agricultural statistics of acreages, yield and production of crops, livestock and poultry inventories, and other information pertaining to Oklahoma's agricultural economy.

The most important source of survey data is the farm operator who voluntarily supplies information about his farming operations. Most surveys include a fairly large sample of operators which are surveyed by mail. Some producers may be in a smaller preselected probability sample in which responses are collected by personal interview or by telephone.

Data are also collected from agribusiness firms and merchants serving agriculture. Both suppliers of agricultural inputs and purchasers of raw farm outputs are important sources for developing statistics on agricultural commodities. In addition, these firms can also provide valuable data on quantities marketed or processed, which are used as check data to revise earlier estimates made from sample surveys. Data from these sources are especially useful in the nonprobability mail surveys.

Survey methods have changed significantly during the past two decades and many different sampling and surveying techniques are used currently. Lists of farm operators, including names and addresses, are used for many of the surveys and are well suited for the collection of information by mail. The low cost of data collection from a list sample is one of the principal advantages of this method. Another advantage is the ease with which supplementary information can be included and used to classify operations as to type and size. This allows the use of efficient stratified sample designs.

Today, many probability surveys, using personal interviews and actual field counts to collect data, supplement the mail approach. Enumerative surveys require the collection of survey data pertaining to specific land areas (segments). In Oklahoma, a sample of 360 segments which average approximately one square mile in size are enumerated each year. The information collected is used to supplement mail surveys to provide indications on crop acreages and livestock numbers. Objective counts and measurements are taken each month throughout the growing season from 200 randomly selected wheat yield plots. This information is used to supplement indications of wheat yield provided by the mail responses from monthly crop reporters. The enumerative and objective yield field activities are conducted by approximately 40 part-time enumerators whose work helps provide information for preparing more reliable statistics.

Beginning in 1981, Oklahoma will be participating in a new research project called AGRISTARS. This project is designed to determine if satellite information can be used to improve the precision of crop estimates at the state, crop reporting district and county levels. Another goal is to develop methods which will give early warning to the agriculture industry of changes in crop conditions that may affect production. The project is a cooperative effort of the U. S. Departments of Agriculture, Commerce and Interior, NASA, and the Agency for International Development.

John Waldrop,
Assistant State Statistician

OKLAHOMA CROP—WEATHER SUMMARY

Crop Reporting Board
Oklahoma Crop and Livestock Reporting Service

1980 CROP WEATHER REVIEW

January: The New Year was welcomed with above normal temperatures and mild weather. Temperatures cooled as a cold front passed through the state during the last week of the month. Soil moisture supplies were adequate across most of the state by the month's end. Wheat, however, made limited growth as most of the month was dry. Pastures and ranges provided little grazing but hay supplies were adequate and cattle were in good condition.

February: The month began with below normal temperatures. Sub-zero temperatures were reported in northern areas of the state. By the month's end, temperatures warmed and were back to near normal. Precipitation during the month was generally light. Soil moisture, however, was adequate across most of the state and wheat made favorable growth and development during the month.

March: The month of March roared in like a lion with cold temperatures, strong winds and precipitation. Normal temperatures and March winds prevailed most of the month. Precipitation was above normal in northern areas of the state but below normal in southern areas. Isolated rain combined with strong March winds resulted in reduced soil moisture supplies, statewide. Wheat development was enhanced by late March rains and warm temperatures.

April: Statewide, April weather was conducive to growth and development of wheat and other small grains. April rains relieved earlier moisture deficiencies; however, cooler than normal temperatures contributed to increased activity of greenbugs and allowed the spread of soil-borne mosaic in wheat across the northern half of the state. On the plus side, these cool temperatures were beneficial for the filling of wheat heads.

May: Crop conditions improved during May, as temperatures were somewhat below normal, while above average precipitation was received in most areas of the state. In the drier South Central and Southwest Districts, rain during the month was beneficial to wheat but was generally too late to improve yield prospects substantially. The above normal precipitation slowed spring planting during much of the month and heavy rains during the last half washed out many newly seeded fields, necessitating replanting.

June: Temperatures were normal to above normal during most of June. Scattered rains developed during the first two weeks and heavy general rains occurred during the third week. By the end of the month, the weather had turned hot and dry. Wheat and other small grains were damaged by heavy rains and high winds which occurred during the third week of June. As of the end of June, row crops were generally in good condition, although some late planted cotton and peanuts were beginning to show heat stress.

July: Above normal temperatures and below normal precipitation was the rule throughout drought plagued July and, by the end of the month, topsoil moisture supplies were short statewide, while subsoil moisture supplies were short in 70 percent of the counties. All row crops were hurt by the effects of heat stress and lack of moisture during the month, as the drought took a daily toll on potential yields.

August: Hot, dry weather continued during the first half of August. Scattered rains the last two weeks of the month brought temporary relief to some areas of the drought stricken state. However, by this time, dry land crops in most areas had deteriorated to the point that moisture was not beneficial.

September: Above normal temperatures and generally dry weather prevailed across the state throughout the month. Conditions of growing crops and pastures continued their downward plunge. Scattered showers teased many areas of the state during the middle of the month but generally were not sufficient to provide more than temporary relief. As the month closed out, topsoil and subsoil moisture supplies were short in 95 percent of the state, as the drought continued to sap soil moisture across Oklahoma.

October: Cooler temperatures and much needed precipitation occurred early in the month. Temperatures warmed and were above normal for the remainder of the month. Rainfall improved soil moisture supplies during mid-October across most of the state. Topsoil moisture, however, remained in short supply in most of the western one-third of the state. Precipitation improved conditions for seeding wheat which was behind normal. The mild open weather was favorable for maturing corn and sorghum grains and harvest progressed ahead of normal. Summer drought conditions severely reduced pasture and range grazing.

November: Frost occurred across most of Oklahoma during late October and early November. Temperatures then warmed, averaging near normal during the first half of the month and cooling to below normal in the second half. Much needed precipitation was received around mid-month aiding wheat seeding and germination.

December: Statewide, temperatures averaged near normal during most of the month. Below normal temperatures were recorded in South Central and Southeast areas during mid-month. The first significant precipitation in some time was received during the first week of the month. Light freezing rain occurred in Northeast areas in late December. Wheat continued in fair condition but was aided by early December rains and light snow in addition to unseasonably warm weather.

Monnie A. Miller and Daryl Brinkman,
Agricultural Statisticians

OKLAHOMA CROP PRODUCTION

Crop Reporting Board
Oklahoma Crop and Livestock Reporting Service

1980 CROP PRODUCTION

Oklahoma farmers and ranchers produced less of all leading crops during 1980, as summer weather was too hot and dry for normal plant growth. Seeding of the 1980 winter wheat crop and other small grains was made under less than favorable conditions as dry fall weather during 1979 hindered planting of the 1980 crops. Considerable acreage was dusted in. Winter crops suffered from lack of moisture during most of December 1979 through March 1980. This stress was relieved by cool temperatures and timely rains during April which were extremely beneficial and allowed crops to improve dramatically. Although some acreage was lost due to locally severe flooding, the remaining acreage benefited from cool temperatures and abundant precipitation during May.

Planting of late season crops ran behind normal as above normal precipitation slowed spring planting during most of May. Heavy rains during the last half of the month washed out many newly seeded fields necessitating replanting. Temperatures were normal to above normal during most of June with scattered showers during the first two weeks and heavy general rains during the third week. By the end of the month, the weather had turned hot and dry. At that time row crops were generally in good condition although some late planted cotton and peanuts were beginning to show heat stress. Extremely high temperatures were generally the rule throughout drought plagued July, August and September. All row crops were severely hurt by the effects of heat stress and lack of moisture during this three month period and a substantial reduction in potential yield was the result. The drought that plagued the State from the third week of June through harvest cut sharply into the production of all late season crops. Effects were felt in the form of less acreage for harvest and reduced yields in all areas of the State. Particularly hard hit were dryland acreages of the various crops. The drought also affected irrigated crops; above normal temperatures coupled with hot dry winds made it impossible to apply enough water.

Wheat production for 1980 totaled 195.0 million bushels, down 10 percent from the 1979 record but still the second largest output of record. Yield, at 30 bushels per acre, was 8 bushels below 1979 but tied with 1973 as the second highest of record. Planted acreage, at 7.5 million, was 500,000 acres above the 1979 level. Harvested acreage at 6.5 million, was 800,000 above a year earlier.

Production of sorghum grain totaled 16.3 million bushels, 30 percent below a year earlier and the smallest crop since 1964. Yield at 34 bushels per acre was 11 bushels below 1979 and the lowest yield since 1976. Oklahoma's 1980 peanut crop was severely hurt by the drought as 140.2 million pounds were produced, down 47 percent from a year earlier. Yield per acre was estimated at 1,335 pounds compared to 2,200 pounds for the 1979 crop.

Cotton production, at 205,000 bales, was down 61 percent from the 1979 production. Yield, at 174 lbs. per acre, dropped drastically from the record 432 lbs. per acre a year earlier and was the lowest yield since 1954. Oklahoma's 1980 soybean production totaled 3.0 million bushels, compared to 8.3 million a year earlier due primarily to the lowest yield since 1956.

All hay production, at 2.3 million tons, was approximately two-fifths lower than the 1979 output as alfalfa production dropped by a third and all other hay was down a half.

Cotton and forage are examples of crop diversification in Oklahoma.

OKLAHOMA LIVESTOCK County Estimates

Crop Reporting Board
Oklahoma Crop and Livestock Reporting Service

MEAT ANIMAL PRODUCTION REACHES NEW HIGH

The State's cattle and calf inventory on January 1, 1981 declined despite the current U. S. cattle cycle progressing through its second year of the building phase. Annual average prices received per hundredweight for all livestock categories were down from the previous year. Compared to a year earlier, cash receipts for cattle and hogs increased, but sheep and lamb income was down. Total cash receipts for livestock, total meat animal production, value of production and gross income reached new record levels, surpassing the previous highs set in 1979.

Cattle and calves on Oklahoma farms and ranches totaled 5,400,000 head on January 1, 1981, down two percent from the previous year. The State's cow inventory totaled 2,400,000 head. There were 2,288,000 head of beef cows and 112,000 head of milk cows. Beef cows and milk cow inventories increased 6 percent and 2 percent, respectively, from the previous year. The number of steers and heifers over 500 pounds and calves under 500 pounds was down from 1979 as a result of poor pasture and range conditions during the second half of the year. The average inventory value of $385 per head gives a total dollar value for all cattle and calves on the State's 66,000 farms and ranches of $2.1 billion, 15 percent below last year's record value.

The number of cattle and calves in Oklahoma feedlots on January 1, 1981 was two percent below the previous year and ten percent below the all-time high number on January 1, 1978. Fed cattle marketings during 1980 were three percent below a year earlier and 22 percent below the record number marketed in 1978. Cattle and calves placed on feed were down five percent from 1979 and 19 percent from two years earlier.

Hog numbers increased through the first half of 1980 but declined during the second half of the year. Prices received for hogs in 1980 were at their highest levels during the last few months of the year. The number of hogs and pigs on hand December 1, 1980 totaled 350,000 head on the State's 11,000 hog operations. Total hog inventory was down five percent, breeding stock was down 16 percent, and the number of market hogs was down four percent from December 1, 1979. The 1980 pig crop was 10 percent larger than a year earlier and included 277,000 spring pigs and 270,000 fall pigs. Average value per head of $57.50 resulted in a total inventory value of $20.1 million.

Sheep and lamb inventory continued to increase and marked the fifth consecutive year of expansion. Wheat producers continue to find ewe lambs and winter wheat a profitable combination. Raising sheep on a part-time basis is also popular and profitable. Sheep and lambs on Oklahoma's 2,100 sheep farms on January 1, 1981 increased two percent from a year earlier and included 80,000 stock sheep and 15,000 sheep and lambs on feed. The 1980 lamb crop of 62,000 head was unchanged from the previous year's. Wool produced during 1980 totaled 645,000 pounds, one percent less than the previous year's production. The average value per head of $69.00, which was $4.50 below 1980's record high, resulted in a four percent decline in total inventory value for all sheep and lambs.

1980 DAIRY REVIEW

Oklahoma's January 1, 1981 milk cow population totaled 111,000 head, an increase of 2 percent over the previous year. This is the first increase since 1943 and may mark a reversal of the downward trend in milk cow numbers. Heifers being kept for milk cow replacement totaled 40,000 head, an increase of 14 percent over January 1, 1979.

Milk production of 1,110 million pounds in 1980 was 4 percent above the previous year and the highest output since 1977. Production per cow in 1980 reached a record 10,000 pounds, a 3 percent increase from the previous high achieved a year earlier, but 1,875 pounds below the national average per cow.

An 8 percent increase in average return per hundredweight for milk and cream pushed total cash sales to a record $148.6 million, compared with the previous high of $131.5 million in 1979. Producer returns from combined marketings of milk and cream averaged $13.77 per hundredweight, 62 cents above the national average.

Total milk and cream marketings of 1,079 million pounds in 1980 increased 5 percent from the previous year. Of the total milk produced during 1980, approximately 97 percent was marketed. Nationally, 98 percent of the total milk produced was sold through milk handling channels. An estimated 31 million pounds of milk were used on Oklahoma farms, a decrease of 22 percent from the record set in 1979.

The quantity of whole milk (net whole milk equivalent) utilized in manufacturing dairy products totaled 353.1 million pounds in 1980, compared with 590.5 million pounds the previous year.

Production of creamed cottage cheese, at 9.8 million pounds, increased 5 percent from the previous year. Cottage cheese curd and lowfat cottage cheese also increased from the previous year.

Total frozen dairy products increased 8 percent from 1979 to 14.5 million gallons. Ice cream production reached a record 9.6 million gallons, up 10 percent from 1979 and 8 percent above 1978's previous high. The output of ice milk increased 4 percent and milk sherbet increased 36 percent. Mellorine production decreased 36 percent to the lowest level since records began in 1952.

POULTRY REVIEW - 1980

The number of chickens, excluding broilers, on Oklahoma farms and ranches on December 1, 1980 totaled 3,800,000 birds, down 14 percent from the previous year's record high. The sharp drop in inventory was due largely to the severe heat during the summer months which resulted in the highest death loss since 1960. The average value of all chickens, exluding broilers, on December 1, 1980 was $2.35 per bird, giving a total inventory value of $8,930,000.

In spite of the large death loss, the annual average number of hens and pullets of laying age was 3,462,000, the largest average since 1959. Hens and pullets of laying age averaged 242 eggs per bird during 1980, the highest on record.

Egg production during 1980 totaled 839 million eggs, surpassing 1979's record high by 11 percent. Of the total number of eggs produced, 98 percent were marketed at an average price of 62.5 cents per dozen providing $42,969,000 in cash receipts. Home consumption of eggs was valued at $729,000 bringing the gross value of egg production to $43,698,000 for 1980.

A total of 45,014,000 commercial broilers were produced by Oklahoma farmers, up 12 percent from 1979.

Commercial hatcheries in Oklahoma hatched 1,186,000 egg-type chicks during 1980, a 17 percent increase from the 1979 hatch.

There were 2,000,000 farm chickens (mostly old hens) sold during the year which averaged 17.5 cents per pound, resulting in sales of $1,575,000, up 25 percent from 1979. Home consumption of farm chickens was valued at $70,000, bringing the total value to $1,645,000.

During 1980, a total of 2,215,000 turkeys were raised in Oklahoma, an increase of 17 percent from the previous year's record high. The average liveweight was 18 pounds per bird which accounts for 39,870,000 pounds of total production. The average price received by producers of 41 cents per pound declined one cent from the previous year. The increased production resulted in an 8 percent increase in gross income to $16,347,000.

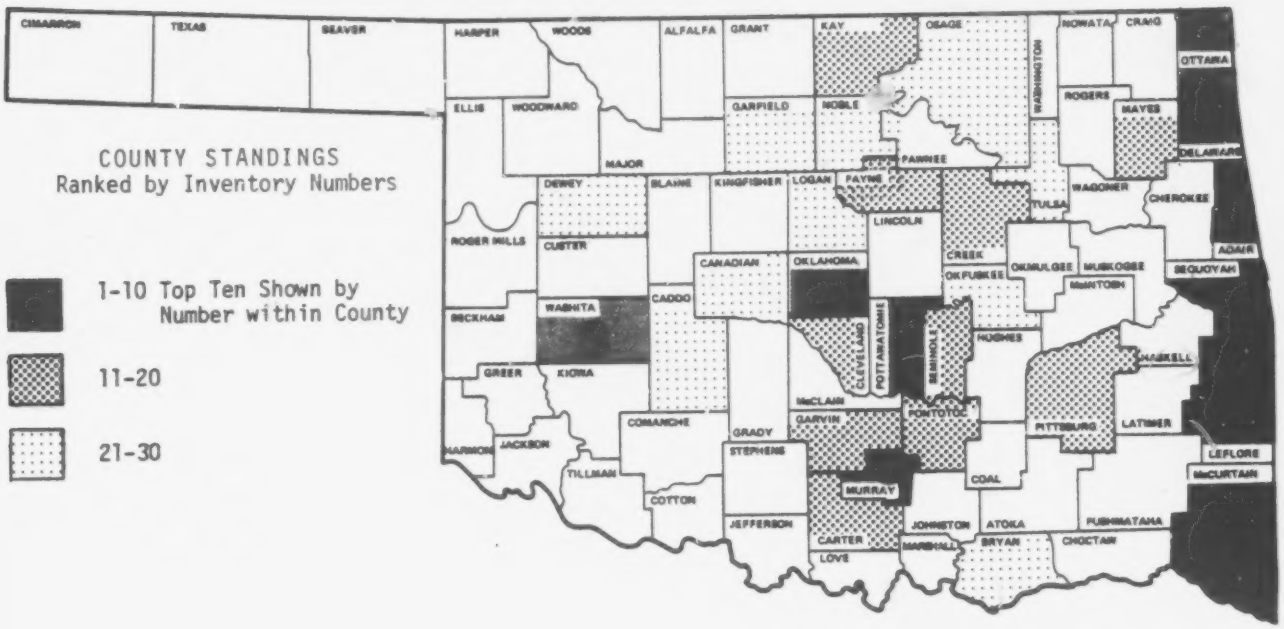
FARM CHICKENS (Excluding Broilers), OKLAHOMA, DECEMBER 1, 1980



OKLAHOMA AGRICULTURAL PRICES

Crop Reporting Board
Oklahoma Crop and Livestock Reporting Service

CROP PRICES STRENGTHEN, LIVESTOCK PRICES FALTER IN 1980

Judging prices in 1980 depends upon whether you raised mainly crops or livestock. The Index of Prices Received for All Farm Products declined to 272 percent of the 1967 base during 1980, down 10 points from 1979. The decline was due to sharply lower livestock prices. Higher crop prices resulting from drought related shortages of supply partially offset the decrease in the all products index.

The Prices Received Index for all crops averaged 270 percent, up 31 points (13 percent) from 1979. This is the highest crop index recorded. Winter wheat averaged $3.85 for the year, down from 1979's average of $3.95. The season average price for cotton lint shot up to 77.4 cents per pound, a 30 percent increase from 1979. Cottonseed jumped 12 percent to $127 per ton. Season average prices of other crops, and the change from 1979, are: grain sorghum, $5.65 per cwt, up $1.50; oats, $2.05, up 25 cents; corn, $3.55, up 85 cents; barley, $2.35, up 5 cents; and rye, unchanged from $2.00. Soybeans jumped from 1979's $5.65 per bushel, to $7.75 for 1980. Peanuts were up 5.8 cents to 25.8 cents per pound and pecans rose to 80.2 cents per pound, a 78 percent increase. Alfalfa hay prices began the year at $73.00 per ton and finished out December at $123.00 per ton.

Livestock prices were generally depressed throughout 1980. The Index of Livestock and Livestock Products averaged 273 percent of the 1967 base, down 31 points (10 percent) from 1979. Beef cattle averaged $62.70 per hundredweight in 1980, a drop of 10 percent for the year. Calves under 500 pounds, at $74.60 per hundredweight, showed a decline of $12.70. Dairy replacement cow prices were strong again, increasing to $1,260 per head, a 22 percent jump. Prices received for milk ranged from $13.70 per cwt in January to $14.80 in December. Hog prices continued to slide. In April, they averaged only $28.20, yielding an average annual price of $37.20 per hundredweight.

Cash receipts from farm marketings in 1980 totaled just over $3.1 billion, a disappointing drop of 3 percent. Crops were able to show an increase in receipts of $21.3 million. Receipts from livestock and livestock products fell almost $117.3 million. Livestock and their products accounted for 63 percent of total farm marketing receipts.

Farm real estate values leaped 18 percent to an average of $522 per acre. Values had been increasing 10 percent each of the last four years.

Dave Ranek
Agricultural Statistician

1/ Revised. Details may not add to totals due to rounding.

2/ Preliminary. Remaining data to be published September, 1981, available upon request.

All income derived from farm operations and Government farm programs is included in the above table. The following description of terms may be helpful in interpreting the table:

Cash Receipts from Farm Marketings - Receipts from sales, loans made or guaranteed by CCC and purchases under price support programs.

Government Payments - Those payments made to farmers in connection with programs such as Agricultural Conservation, Feed Grain, Wheat and Cotton, Disaster Payments, etc.

Non-Money Income - Includes the value of farm products consumed directly in farm households and the rental value of housing provided by farm dwellings. Expenses associated with these products and the dwellings are included in the production expense estimates, thus the non-money imputations do not add on a dollar-for-dollar basis to the net.

Realized Gross Farm Income - The sum of the above income sources.

Farm Production Expenses - Cost of current operations including hired labor, repairs, feed, seed, livestock, depreciation on production facilities (excludes new capital equipment, taxes, and rents).

Realized Net Farm Income - Realized gross income minus production expenses.

Net Change in Farm Inventories - Value of change in quantities of crops and livestock products kept on farms from one year to the next (may be a minus value).

Total Net Farm Income - Realized net income plus the net change in inventories.

FARM INCOME, OKLAHOMA, 1970-1979
